

ASYMMETRIC BENDING CYLINDERS WITH 3 ROLLERS

These machines represent the technical solution most advanced for the curled one in cold of sheets. The range includes from manual bending machines up to the motorized ones most advanced of the market. All the parts in movement are lubricated and mountings on bearings discharges it loads dynamics and a low coefficient of friction, in order to guarantee an ideal performance, with the consequent reduction of the energy used for the curled one.

All this machinery is of great quality and adjusts to the perfection to the demand of our clients.

We have Technical own Service for all our machinery.

If major information wishes about the machinery of sheet, or any of our products, you can accede to our web page: www.JGM.es and there you will find everything who wants to know.

PRESS-BRAKES MACHINES SYNCHRONIZED FOR SHEET

On a purely mechanical concept like it is the hydraulic press-brake of twist, the incorporation of the electronics has revolutionized the system with a basic beginning: To eliminate to the maximum the mechanical components and to obtain a press-brake synchronized, where the intervention of the workman is directed by the own machine and this way to relieve the manual dependence, obtaining hereby, the folded one of quality and a production much more raised with less specializing personnel.

UNIVERSAL SHEARS AND HYDRAULIC PUNCHING MACHINES

Machinery supported with more de30 years of experience in the sector of the deformation of sheet. Wide range of universal shears and punching machines with an important number of models where to be able to select most adapted for the needs of the workshop. We must highlight the usefulness of this product that manages to be indispensable as auxiliary machine in all the workshops for his versatility of work. The offer is completed by a high number of tools and accessories that facilitate and give major options to the machines.

HYDRAULIC SHEARS OF PENDULOUS CUT

This machine is constructed in form mononote-pad by welded and stabilized steel. This system allows to hold the bascule one or bridge in two points of the framework with a guides' total absence and consistently of points of greasing, guaranteeing of for life the whole structure of the machine. To all that there join all the hydraulic and electrical parts that complement a product of excellent level. The range of shears includes a length of cut from 2 to 4 meters and with thicknesses of sheet from 4 to 8 mm.

BENDING MACHINES OF PROFILES

Designed and made with the most modern technologies. They have rollers guides mechanical wings and the way of work can be horizontal and vertical. They incorporate a pedal into safety device and it fulfills strictly the safety regulation of the CE. As optional equipment special support can be added special rolls for pipes, profiles and bars - angles, lateral hydraulic guides, for angles and digital visor of position of the piece.
